this practical guide presents leahy s multidimensional model of resistance in cognitive therapy richly

illustrated with case examples and session vignettes the book addresses a variety of ways that clients may resist basic therapeutic procedures noncompliance with agenda setting and homework assignments splitting transference with other therapists inappropriate behavior and premature termination underlying processes of resistance are explored from the desire for validation to risk aversion and self handicapping also highlighted are ways that the therapist s own responses may inadvertently impede change provided are innovative tools for getting treatment back on track including targeted interventions in session experiments and questionnaires and graphic models to share with clients

despite growing recognition of the importance of context responsivity in psychotherapy and recommendations to develop context responsive models through identification of clinical markers to which therapists need to be responsive the notion of context responsivity in relation to key markers such as resistance remains largely understudied the current study sought to examine therapist responsiveness during identified moments of resistance i e client disagreement with therapist direction in the context of cognitive behavioural therapy cbt for generalized anxiety disorder westra et al 2015 there were two ways in which context responsivity was investigated the first was to examine whether differences in therapist style i e more supportive and less directive behaviour in the presence of disagreement go on to predict proximal i e level of subsequent resistance in the session following therapist management of resistance and distal i e pre to post worry reduction therapy outcomes to this end the present study utilized the manual for rating interpersonal resistance westra et al 2009 to identify moments of client disagreement with therapist direction in turn the motivational interviewing treatment integrity miti moyers et al 2010 was used to rate therapist use of theoretically indicated motivational interviewing mi skills e g level of empathy collaboration evocation and support of client autonomy during identified moments of disagreement the second approach to investigating context responsivity was through comparing variations in therapist mi adherence in the presence of disagreement with variations in therapist general mi adherence during randomly selected moments in therapy in order to examine whether the timing of therapist use of mi principles differentially impacts treatment outcomes results indicated that clients whose therapists displayed higher levels of mi relational conditions in the context of disagreement had substantially lower levels of subsequent resistance and post treatment worry furthermore while variations in therapist mi adherence in the context of disagreement were consistently and substantially related to cbt outcomes variations in therapist general mi adherence were not these findings provide support for the context responsivity hypothesis and serve to suggest that systematic incorporation of the client centered relational conditions advanced in mi to the responsive management of resistance in cbt is a valuable clinical endeavor which should become a priority for clinical training

resistance and the process of therapeutic change paul l wachtel psychotherapy whether practiced from a psychodynamic or a behavioral point of view is rarely as straightforward as textbooks and case reports usually seem to imply more often the work proceeds in fits and starts and often does not

seem to be proceeding at all but rather unraveling or moving backward the typical case is in fact quite atypical almost all cases present substantial difficulties for which the therapist feels at least some of the time quite unprepared practicing psychotherapy is a difficult if also rewarding way to earn a living it is no profession for the individual who likes certainty predictability or a fairly constant sense that one knows what one is doing there are few professions in which feeling stupid or stymied is as likely to be a part of one's ordinary professional day even for those at the pinnacle of the field indeed i would be loath to refer a patient to any therapist who declared that he almost always felt effective and clear about what was going on such a feeling can be maintained i believe only by an inordinate amount of bravado and lack of critical self reflection but the therapist trying to get some ideas about how to work with 1 these are of course not the only two points of view in psychotherapy nor do i believe they are the only two of value
